

# National Ignition Facility & Photon Science

## The National Ignition Facility at a Glance

The National Ignition Facility (NIF) is the world's largest laser system, housed in a 10-story building the size of three football fields at Lawrence Livermore National Laboratory, east of San Francisco.

NIF's 192 laser beams are capable of delivering at least 100 times more energy than any previous laser system. During full-scale ignition experiments, NIF will focus up to 1.8 million joules of ultraviolet laser energy on a tiny target in the center of its 10-meter-diameter target chamber—creating conditions similar to those that exist only in the cores of stars and giant planets and inside nuclear

weapons. The resulting fusion reaction will release many times more energy than the laser energy required to initiate the reaction.

Experiments conducted on NIF will make significant contributions to national and global security, could lead to practical fusion energy, and will help the nation maintain its leadership in basic science and technology.

Building NIF and performing National Ignition Campaign experiments has been enabled by an international collaboration among government, industry, academia, and industrial partners. ■

### NIF Control Room

NIF's complex operation, alignment, and diagnostic functions are controlled and orchestrated by the integrated computer control system.

It consists of 300 front-end processors attached to nearly 60,000 control points, including mirrors, lenses, motors, sensors, cameras, amplifiers, capacitors, and diagnostic instruments.

The shot director (left) must coordinate all NIF subsystems when preparing for a shot.

## NIF's Missions

- Support the U.S. National Nuclear Security Administration's Stockpile Stewardship Program, which ensures a safe, secure, and reliable nuclear stockpile, by conducting experiments to enhance understanding of the physics of nuclear weapons.
- Demonstrate the feasibility of inertial confinement fusion as a clean source of energy.
- Enable advances in fundamental high-energy-density science that will aid in understanding the basic physical processes that drive the cosmos.

## NIF Timeline

<b>JANUARY 1993</b>	..... NIF's conceptual design study approved
<b>MAY 1997</b>	..... NIF groundbreaking ceremony
<b>JUNE 1999</b>	..... Target chamber dedicated
<b>DECEMBER 2002</b>	..... First tests of four laser beams generate 43 kilojoules of infrared light in a pulse lasting five billionths of a second
<b>MAY 2003</b>	..... NIF produces 10.4 kilojoules (kJ) of ultraviolet light in a single laser beam, setting a world record
<b>JULY 2007</b>	..... First laser bay completed and commissioned
<b>OCTOBER 2008</b>	..... Second laser bay completed and commissioned
<b>DECEMBER 2008</b>	..... All 192 target chamber final optics installed
<b>JANUARY 2009</b>	..... All line replaceable units installed; all project performance completion criteria met, including 96-beam pulse energy of 540 kilojoules (500 kJ required) and 207 terawatts of peak power (200 TW required)
<b>MARCH 2009</b>	..... 1.1 megajoules of ultraviolet energy fired to target chamber center
<b>MARCH 2009</b>	..... Formal certification of NIF project completed by National Nuclear Security Agency
<b>MAY 2009</b>	..... NIF dedicated
<b>SUMMER 2009</b>	..... 192-beam experimental shots
<b>SEPTEMBER 2010</b>	..... First integrated ignition experiment performed
<b>JULY 2012</b>	..... NIF delivers more than 500 terawatts of peak power and more than 1.8 megajoules of ultraviolet light to target.

## NIF by the Numbers

<b>TOTAL LASER ENERGY</b>	..... 4.2 million joules (infrared)
<b>ENERGY ON TARGET</b>	..... 1.8 million joules (ultraviolet)
<b>EQUIVALENT PEAK POWER</b>	..... 500 trillion watts (20-nanosecond shaped laser pulse)
<b>LARGE (METER-SCALE) OPTICS</b>	..... 7,500
<b>SMALL OPTICS</b>	..... More than 26,000
<b>COMPUTER CONTROL POINTS</b>	..... 60,000
<b>TARGET CHAMBER DIAMETER</b>	..... 10 meters
<b>TARGET CHAMBER WEIGHT</b>	..... 130 metric tons
<b>TARGET DIAMETER</b>	..... ~2 millimeters
<b>TARGET TEMPERATURE AT IGNITION</b>	..... >100 million degrees Centigrade
<b>TARGET PRESSURE AT IGNITION</b>	..... >100 billion atmospheres
<b>NEUTRONS RELEASED DURING IGNITION</b>	..... ~6 quintillion ( $6 \times 10^{18}$ )
<b>ENERGY RELEASED DURING IGNITION</b>	..... ~20 million joules ■
